

WIMWitch 2.1.0 Upgrade

In this post, I will show you the upgrade process for above.

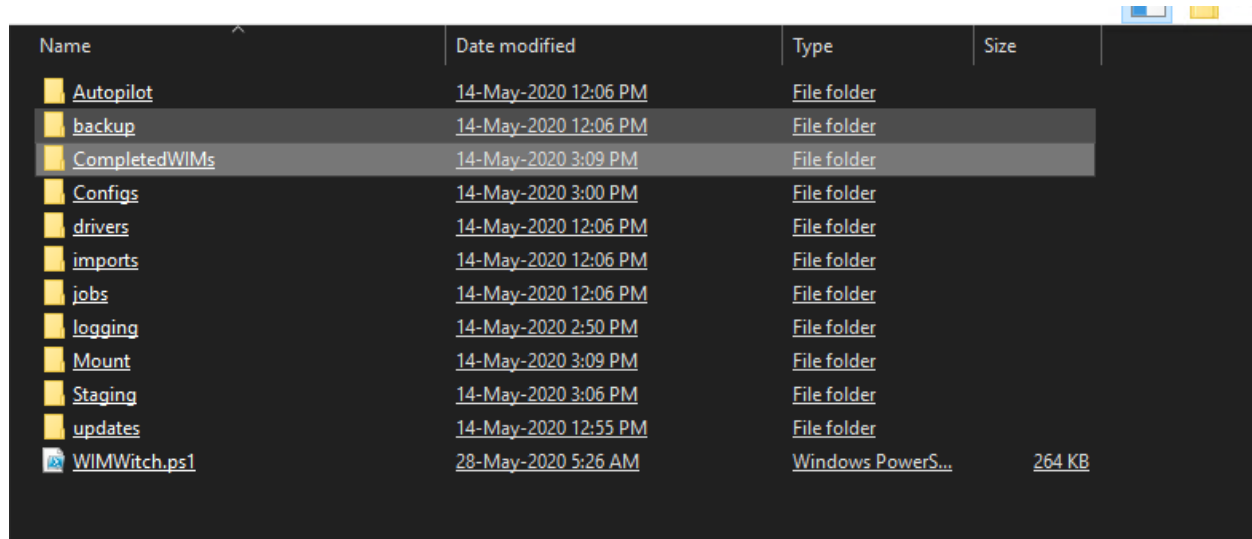

I did update WIMWitch on 14th May to v2.0.1. Now we will update to v2.1.0.

To update open PowerShell and change directory to the patch where you have WIMWitch folder and run below command. The update will be fast and the window will close. So, don't panic

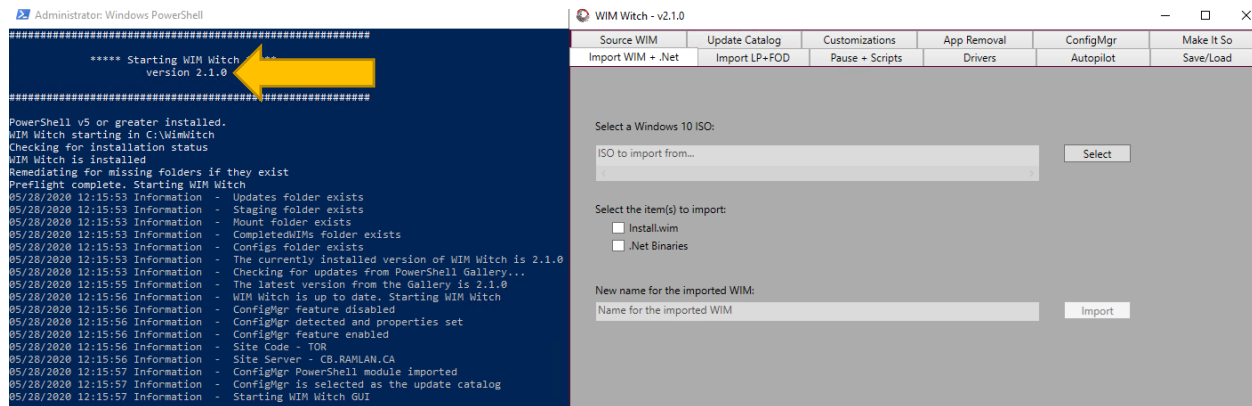

save-script -name WIMWitch -path c:\wimwitch -force

Now you can see it is dated today. Open PowerShell – change directory to C:\WIMWitch and run WIMWitch.ps1

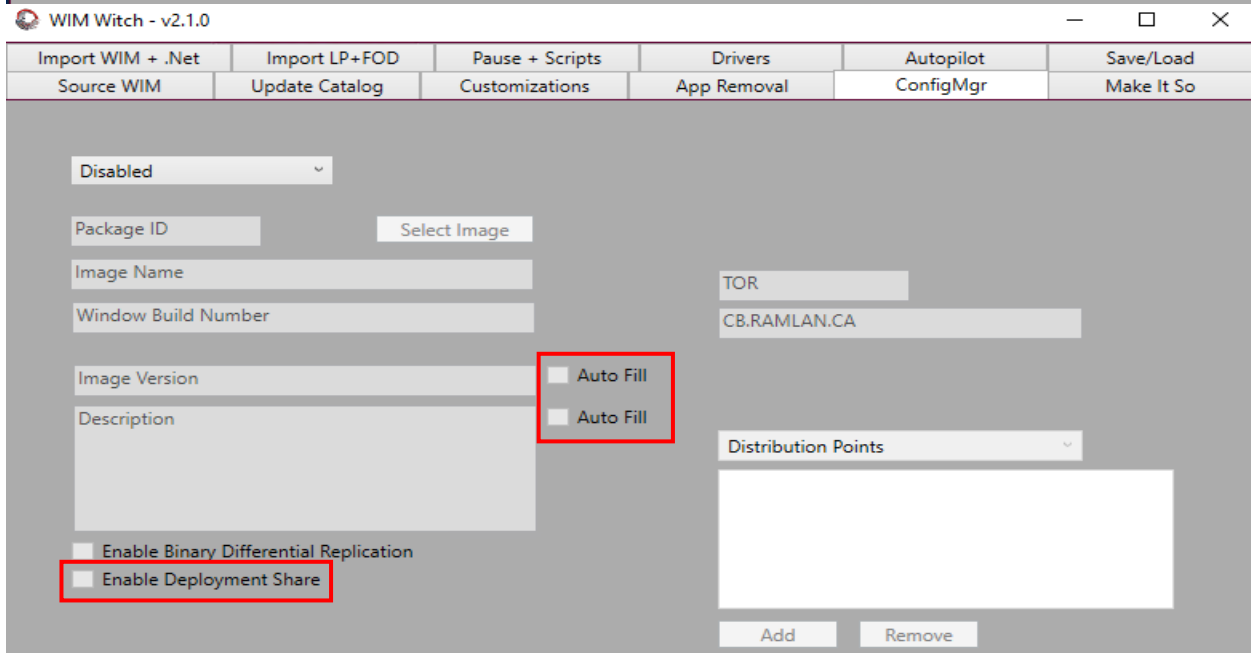

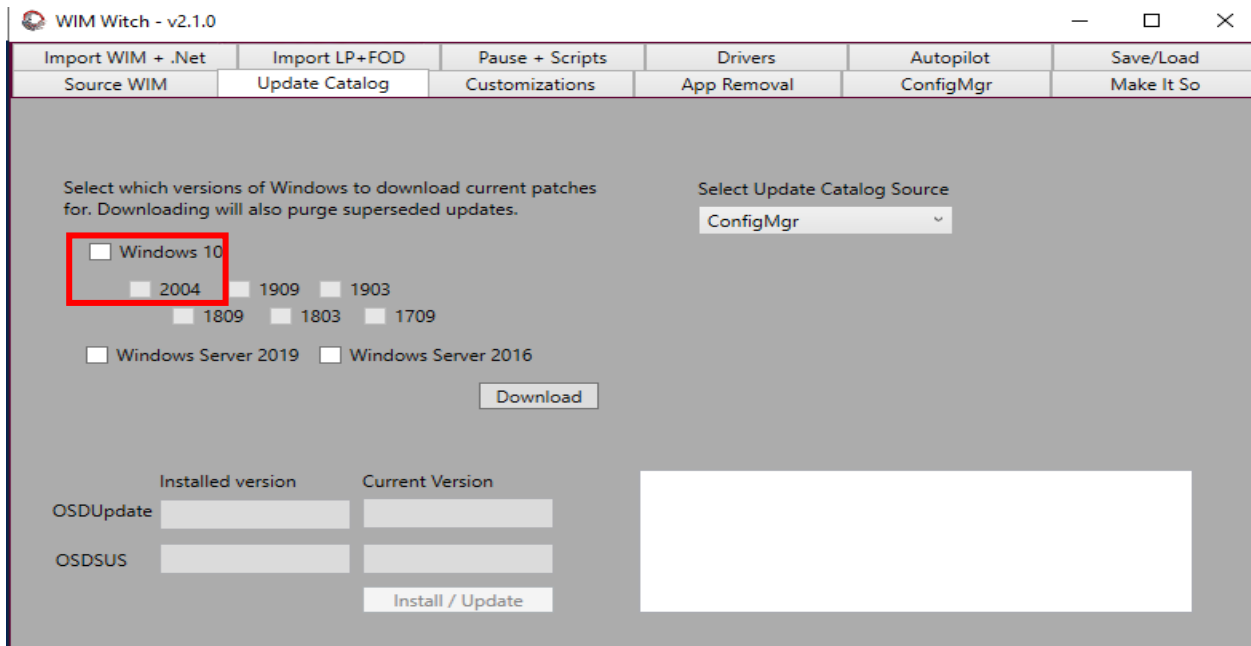

This is what you will see.

What is new in v2.1.0?

1. Windows 10 v2004
2. ConfigMgr – Deployment Share & AutoFill

Everything else is same. If you want you can refer to my previous post
