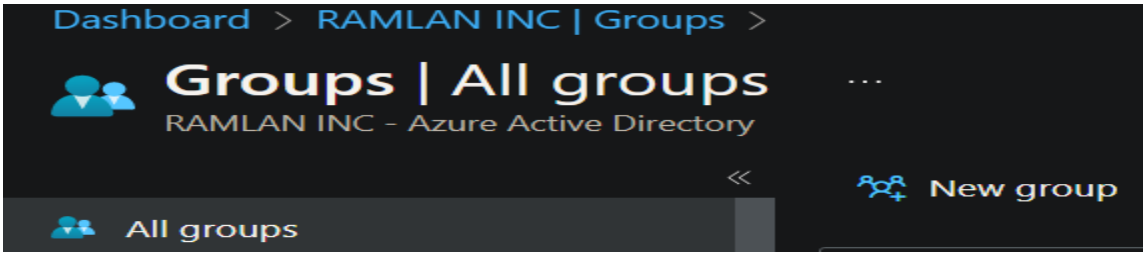
How to deploy Windows version 22H2 to Windows 365 Cloud PC

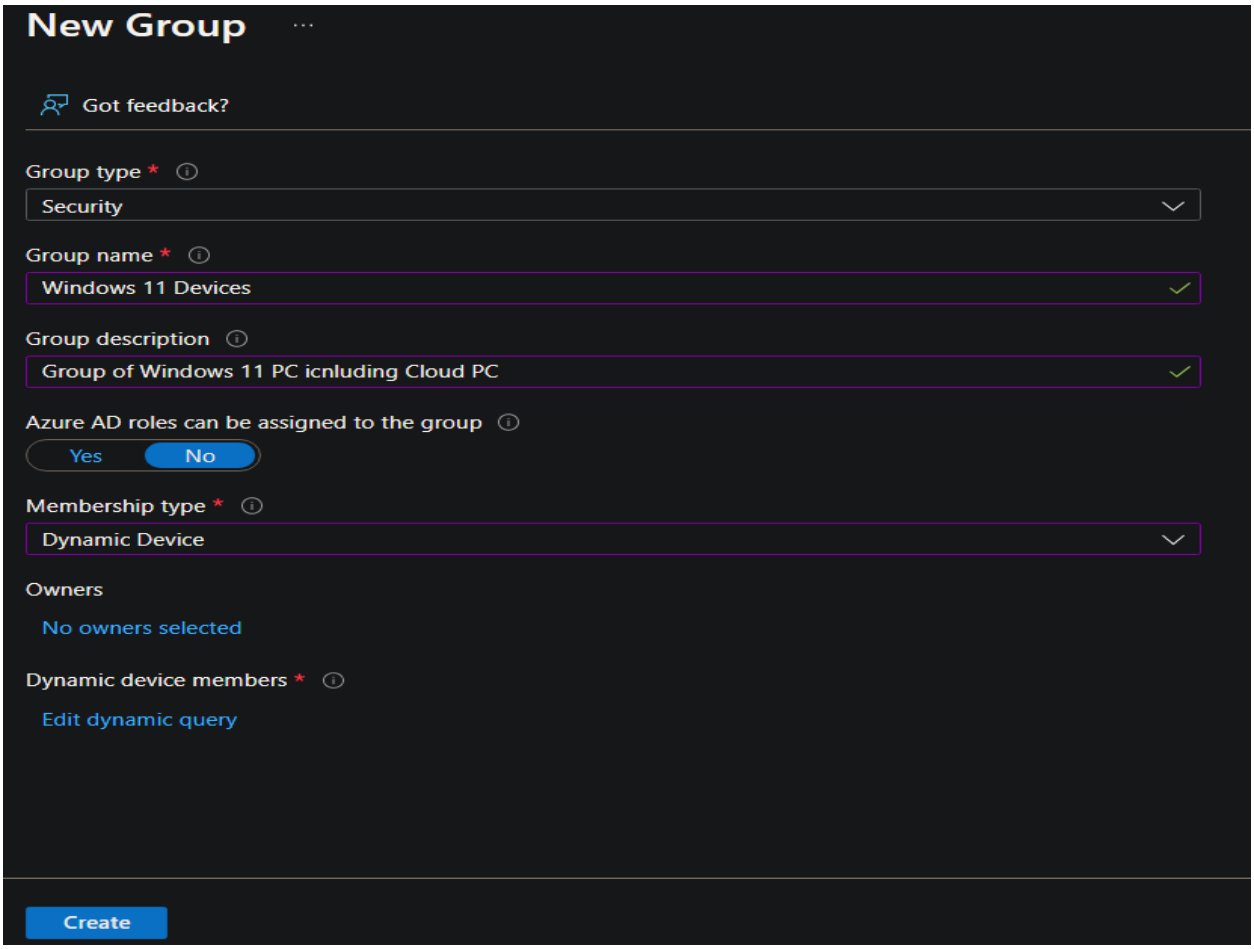
In this post, I am going to upgrade current version of Windows 11 21H2 to 22H2 for Windows 365 Cloud PC through Intune MDM. Microsoft released 22H2 on 20th Sep. So, it is time to create the following:

1. Create Windows 11 Device Group
2. Create, Configure and Deploy Feature Updates for Windows 11

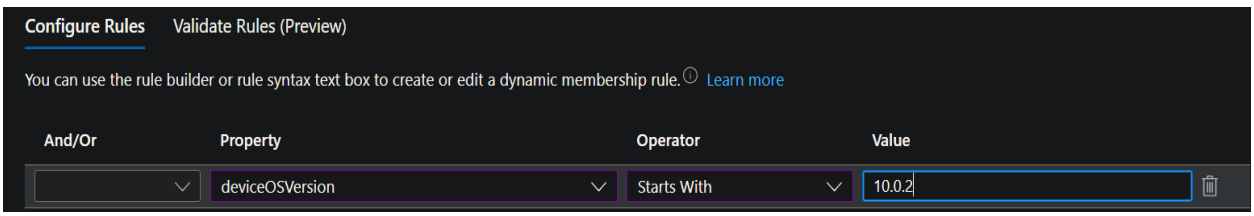
WINDOWS 11 DEVICE GROUP:

Login to Azure Portal -> Go to Azure Active Directory -> Groups -> All Groups



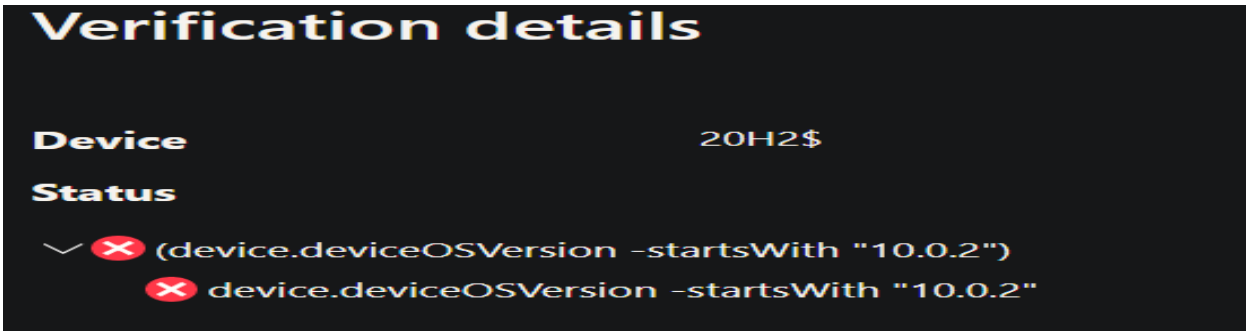


Configure Rules as outlined below

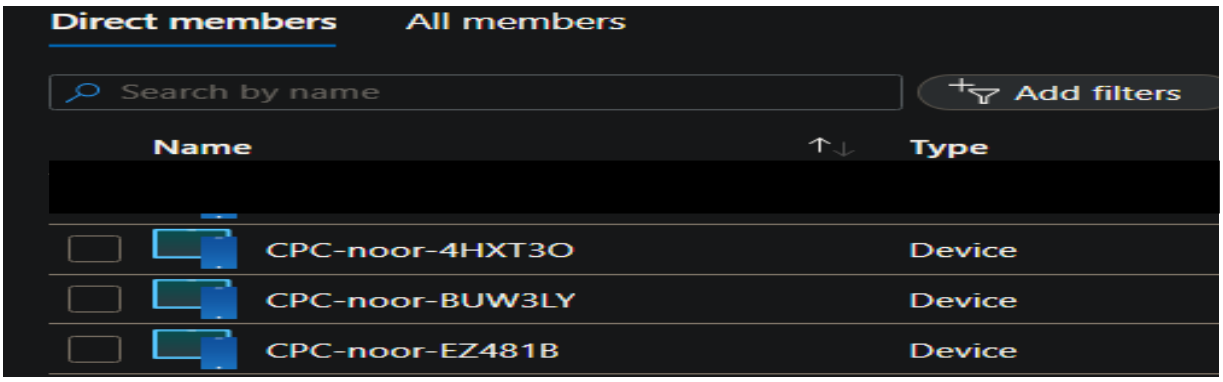


Add Windows 11 devices and then validate rules

Add one or two devices that are currently running Windows 10 and Windows 11. You will see Windows 10 validation result as FAILED.



Now look at the members tab within Windows 11 Devices Group. You should see the devices that are running Windows 11.



CREATE, CONFIGURE & DEPLOY FEATURE UPDATE 22H2 FOR WINDOWS 11 DEVICES:

Login to MEM Admin Center (Intune Portal) – endpoint.microsoft.com -> Devices -> Feature Updates for Windows 10 and later (Preview)

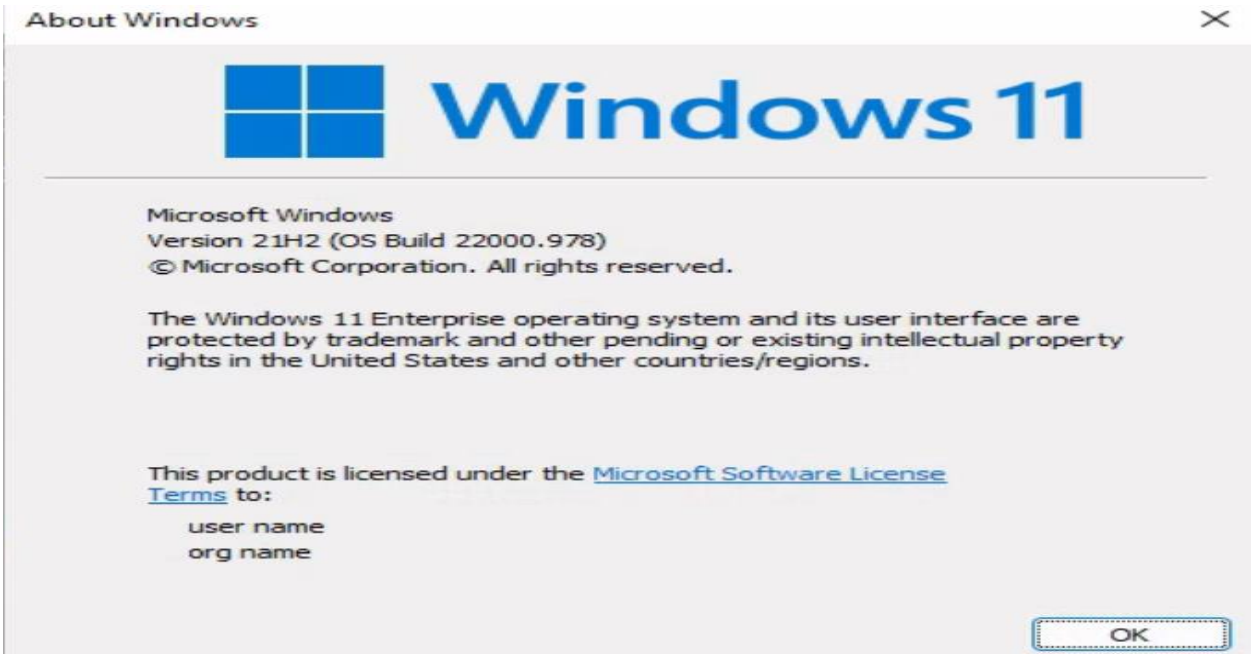
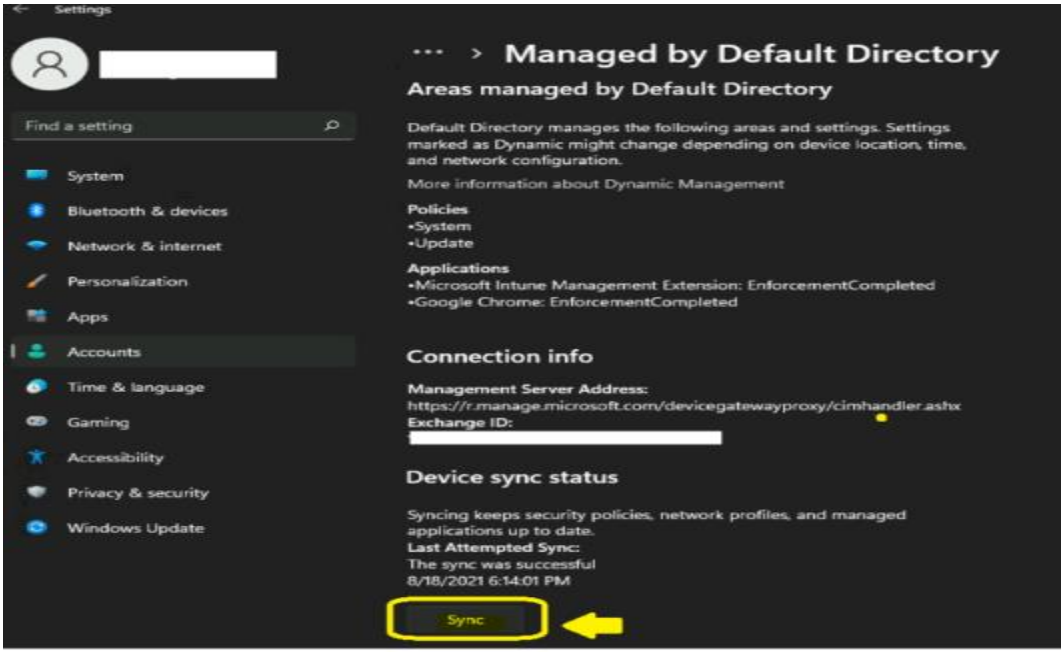
This system is currently running 21H2.



As per our configuration 22H2 will be available for this device from 23rd Sep onwards. You can perform the sync to get this update from Settings -> Accounts -> Access work or school -> Select your account and perform sync – below screen shot is just an example.



This is how you can deploy Windows 11 22H2 through Intune MDM.

Thanks
