

# WSUS POST CONFIGURATION ERROR

In this post, I will show you how to resolve the issue when completing WSUS post configuration. I was getting this error when, I finished installing WSUS role and was trying to complete post configuration task. This is the error.

Microsoft.UpdateServices.Administration.CommandException: A required configuration value was not found in the system. This is usually caused by installing WSUS through PowerShell and not specifying a configuration file. The fix is as follows:

Open PowerShell as Administrator

Go To **C:\Program Files\Update Services\Tools**

**Run this command**

```
.\wsusutil.exe postinstall content_dir=C:\Sources\WSUSUpdates sql_instance_name=XXXXXX
```

```
PS C:\Program Files\Update Services\Tools> .\wsusutil.exe postinstall content_dir=C:\Sources\WSUS sql_instance_name=CB
Log file is located at C:\Users\Administrator.RAMLAN\AppData\Local\Temp\WSUS_PostInstall_20190106T205213.log
Post install is starting
Post install has successfully completed
PS C:\Program Files\Update Services\Tools> █
```

If you used default instance then you have to enter host name of the server. In my configuration, I am saving WSUS updates in Sources folder. If you are saving the update in a different folder change the location within the PS command.

Thanks

**Ram Lan**
