How to install KB4553501 on Current Branch 2002

Microsoft released an update for CB2002. This is for fast ring users who deployed CB2002 before it was released to general public. If you installed CB2002 this week, you will not need this update.

An update is available to administrators who opted in through a PowerShell script to the early update ring deployment for Microsoft Endpoint Configuration Manager current branch, version 2002. You can access the update in the Updates and Servicing node of the Configuration Manager console.

This update addresses important, late-breaking issues that were resolved after version 2002 became available globally. This article summarizes the most significant changes.

This update does not apply to sites that downloaded version 2002 on May 11, 2020, or a later date. Therefore, it will not be listed in the Configuration Manager console for those sites.

The details of the update are in the link

Client Update Settings

This update includes an update for the Configuration Manager client. You can upgrade your clients immediately, or validate this client in a pre-production collection before you upgrade all your Configuration Manager clients.

◉ Upgrade without validating

Overwrites your current Configuration Manager client package with the new client update. All new client installations and client upgrades use this new client update.

◯ Validate in pre-production collection

Validate the client update on members of the pre-production collection while you keep your production client package intact. Later, you can overwrite the production package using Client Update Options in the Updates and Servicing node of the Configuration Manager console.

Pre-production collection:
