

How to install KB4567007 for Current Branch 2002

In this post, I will show you the steps for installing above KB. MS released the fix this week and the details are as follows.

<https://support.microsoft.com/help/4567007>

PXE Boot failures or task sequence delays after updating to Configuration Manager current branch, version 2002

Applies to: Microsoft Endpoint Configuration Manager (current branch – version 2002)

Symptoms

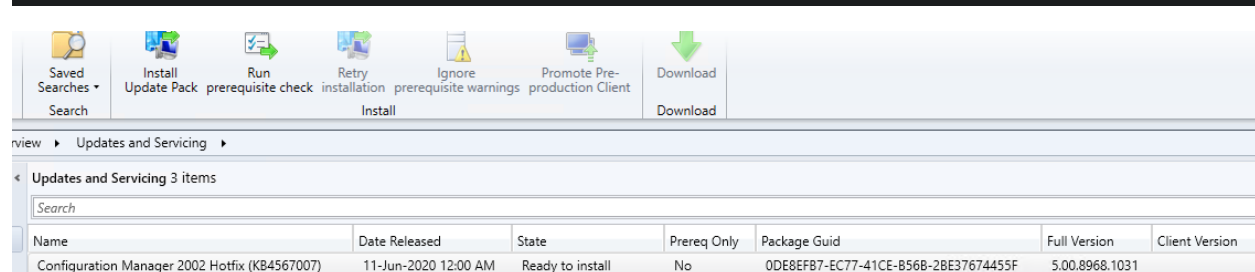

After updating to Microsoft Endpoint Configuration Manager current branch, version 2002, operating system deployment task sequences fail during the PXE boot process. This occurs more frequently in environments with a large volume of packages in the task sequence.

The SMSPXE.log file will show a time difference of 30 seconds or more in between corresponding *Operation: BootRequest* and *Operation: BootReply* entries. There are no explicit errors recorded before the boot process times out. In addition, the **Resolving Task Sequence Dependencies** process of a task sequence may take considerably longer than expected when multiple dependencies are present.

In both cases the CPU of Microsoft SQL Server on the site database will show higher than expected usage.

Update information for Microsoft Endpoint Configuration Manager current branch, version 2002

This update is available in the **Updates and Servicing** node of the Configuration Manager console for environments that were installed by using early update ring or globally available builds of version 2002.

This complete KB install. I did test PXE – to see ,if there is any issue with PXE booting – nothing found.

Thanks

Ram Lan
